

VEILED CHAMELEON CARE

The Veiled or Yemen chameleon originates, as its name would suggest, from Yemen and Saudi Arabia. In its natural environment it spends the majority of its time in trees or bushes and will feel most secure when perching at a height. This is one of the larger chameleons, and probably the easiest species to keep, although all chameleons are high-maintenance pets and not recommended for first time reptile keepers. They can live for 4-7 years in captivity.

HOUSING

- As large a vivarium as possible should be provided to enable room for exercise, and a thermal gradient to be created along the tank (hot to cold). Vertical space is important for this arboreal species so vivaria should be taller than they are wide. Mesh sided vivaria are ideal as this provides the lizard with good ventilation yet still with some visual security. Wooden vivaria can also be used, although additional ventilation holes may need to be created. We recommend a minimum vivarium size of 24x24x48".
- Hides and foliage are important to provide security. Artificial/real plants, cardboard boxes, plant pots, logs or commercially available hides can be used. They should be placed both at the warm and cooler ends of the tank. The vivarium should have a vast amount of greenery to allow the chameleon to feel secure and comfortable in their environment.
- There are a number of commercially available substrates available for lizards including many soil / sand mixes. Care should be taken not to feed your lizard directly on the substrate to avoid accidental ingestion and blockages (especially with wood chip or sand based substrates). Newspaper or paper towels are easy to maintain and can work well in the short-term. However, they do not allow for natural behaviours so for longer term housing, it is worth considering more natural substrate types.
- The vivarium should be spot cleaned as soon as any waste appears to help prevent disease and fully cleaned once a month with a reptile safe disinfectant.

TEMPERATURES AND HUMIDITY

- Reptiles depend on external heat sources to regulate their body temperature, so supplementary heating is required to create a temperature range.
- Typically a basking area is created using a light emitting spot bulb, providing a basking temperature of 35°C. This should be kept on for a minimum of 12 hours a day and switched off at night.
- Heat sources must be attached to a thermostat and measured with a digital maximum/minimum thermometer to ensure the tank does not overheat. The cool end should be maintained at ~25°C.
- Background heat can be provided with a heat mat (on the back wall) a tubular heater, a heat plate or a ceramic bulb. This should be set on a thermostat so that the overnight temperature does not drop below ~23°C.
- Heat sources should be guarded to prevent thermal burns (see separate handout on heating for reptiles).
- Humidity should be checked with a hygrometer placed in the middle of the vivarium and kept at between 75-80% by spraying or fogging the enclosure at regular intervals.

LIGHTING

- Chameleons need daily exposure to full spectrum lighting (including UV-b light).
- Various UV lamps are available (see separate handout on lighting for reptiles), but for veiled chameleons a lamp with a high output (e.g. 10-12%) should be used to mimic the strong sunlight of their wild environment.
- Lamps should be kept on for ~ 12 hours per day and at an appropriate distance from the lizard as recommended by the manufacturer. A branch or rock can be placed below the basking site.
- All lamps should be changed at least as frequently as manufacturer's instructions or checked regularly for their UV output at animal level (bearing in mind that any mesh will reduce the amount of UV which reaches the animal).

WHAT TO FEED

- Chameleons are insectivores although may take the occasional piece of plant matter in the wild.
- Invertebrate prey such as house crickets, black crickets and locusts should form the majority of the diet. Mealworms should only be given in moderation while waxworms and morio worms should only be given as occasional treats due to their high fat content.
- Live food should be gut loaded before feeding to your lizard, ideally with a complete invertebrate diet. Live food should also be dusted with both vitamin and mineral supplementation regularly. We recommend alternating dusting with a calcium supplement (e.g. Calcidust) and a combined vitamin/mineral supplement (e.g. Nutrobal). Live food should be fed immediately after dusting and removed from the enclosure if not eaten within 30 minutes.
- Water should always be available and a container is required which will allow the lizard to submerge completely. This should be changed daily. Chameleons do, however, primarily obtain their water from droplets on plants so regular spraying is also important.

COMPANIONS

- In general the happiest lizard is the solitary lizard so we recommend housing alone.

SALMONELLA

- All reptiles can potentially carry Salmonella.
- However it is rarely a cause of illness in reptiles and treatment is not required.
- It can be transmitted to people (especially young children or those who are immuno-compromised) so good hygiene after handling the reptile is important. Generally washing your hands in soap is sufficient. There are commercially available disinfectants that can be used as an alternative.

ANNUAL HEALTH CHECKS

We recommend annual health checks every year for pet reptiles as medical problems are more easily treated if detected at an early stage – **you can register for automatic reminders**

INSURANCE

We highly recommend that you take out a pet insurance policy. For a monthly fee your pet can receive the best treatment at an affordable cost. There is normally an excess to pay for each condition then after that costs are

Reviewed December 2022

covered up to a set limit. Once you have the policy, please provide us with a copy of your insurance details. There are a lot of different companies and policies available and we suggest you contact a number of them for information- we have a leaflet advising what to look out for. Our advice is to choose a policy which provides cover for chronic illness for the life of your pet. If this policy is too much for you then the best cover you can afford will provide piece of mind in an accident or emergency.
