

Groppo Trail Research Aircraft

Why choose the Groppo Trail for research?

- 
- The **compact size** is convenient for shipping the aircraft to research destinations
 - Good **low-speed performance** and handling allows safe circling over animals being studied
 - **Quiet** in the air so that disturbance to animals is minimal, not affecting their natural behaviour
 - The **high wings** allow good visibility of the ground, which is valuable for tracking animals.
 - A **rugged “tailwheel”** undercarriage design can withstand rough, temporary airstrips in the African bush
 - The aircraft has **folding wings** for storage. This is crucial when working in the Okavango Delta in Botswana as the aircraft must be stored away daily
 - The low purchase, operating and maintenance costs make it **affordable**
